

Replication

There are 2 ways to replicate the results. In both ways you will want to delete the already existing result files 'neural_network_results.txt', 'linear_regression_results.txt' and 'comparison_results.txt'.

Keep the trained models

The first way is to keep the pre-trained models and run the testing again. To replicate the results:

1. Run the 'LinearBaseline.py' file
2. Run the 'NeuralNetwork.py', select option 2 then exit.
3. Run the 'comparison.py'

Delete trained models

The second way is to start from scratch and train the models again. Note that this method may take time, depending on the power of your machine and that due to the slight non-deterministic behaviour of the neural network, the replicated results won't be as exact as the experiment. However the values will be significantly similar and the same conclusions will still be met.

To replicate the results:

1. Delete the models inside the /models directory but do not delete the directory itself.
2. Run the 'LinearBaseline.py' file
3. Run the 'NeuralNetwork.py', select option 1 (this may take time). Once that is complete exit the program.
4. Run the 'comparison.py'

After this all the results will be fully replicated, you can browse the output of the 'comparison.py' file or the 'comparison_results.txt' file to see all the results of the experiment.
